Standard *shapes* of information security:

- ▶ Confidentiality
- ▶ Integrity
- ▶ Availability

*There is a new security that we want to obtain: **Anonymity**
Anonymity [...] means that the personal identity, or personally
identifiable information of that person is not known.*

There are a lot of anonymity driven software online, like *i2p*, *freenet* or *Tor*, we will talk about the last one because is the most used and expanded in the real world (2 million of client per day!).

The onion routing model is a way to gain anonymity on the net:

- ▶ Provides anonymity
- ▶ Protects from sniffing

Introduced by David Goldschlag, Paul Syverson and Michael Reed in the 1999.

It recalls an onion because every step **peel** a layer.
Let us see an implementation.

Overview

Tor is a group of volunteers that operates to defend anonymity online. The system is based on an interconnection of machines, called **routers**. It operates over the network level 4.

It operates as follow:

Tor

Allow the network configuration through:

- ▶ The number of TOR exit nodes in the simulation.
- ▶ The number of TOR 4authorities¹ nodes in the simulation.
- ▶ The number of clients (simpletcp) of the simulation.
- ▶ The number of servers (simpletcp) of the simulation.
- ▶ The percentage of clients tracked by an autosys plug-in.
- ▶ The percentage of servers tracked by an autosys plug-in.
- ▶ The density of the network-requests.

¹A 4 Authority node is simply the database that keep track of the state of the TOR network and the list of the TOR relays/exit-nodes

The connection densities are the sleep time thresholds between each client connection request:

- ▶ Slow: 800 (mean) - 2000 (mean) milliseconds
- ▶ Average: 80 (mean) - 1000 (mean) milliseconds
- ▶ Fast: 20 (mean) - 100 (mean) milliseconds

Simulazione di Sistemi

Algorithm 2 Launcher script

```
for ( $simulation\_run \leftarrow 1$ ;  $simulation\_run \leq steps$ ;  $simulation\_run++$ ) do
2:   for ( $sim\_id \leftarrow 1$ ;  $sim\_id \leq simulations\_per\_step$ ;  $sim\_id++$ ) do
       for all  $density$  in ( $slow, fast, average$ ) do
4:       if The client trace percentage is not fixed then
            $client\_trace\_value \leftarrow sim\_id / simulations\_per\_step$ 
6:       end if
       if The server trace percentage is not fixed then
8:        $server\_trace\_value \leftarrow sim\_id / simulations\_per\_step$ 
       end if
10:      if A configuration is present for  $\langle sim\_id, density \rangle$  And the percentages are fixed then
           Use the previous configuration
12:      else
           Generate a new configuration with net-builder
14:      end if
           Launch the Shadow Simulator with the appropriate configuration.
16:      end for
       end for
18: end for
```
